

Summary

Our project aims at benefiting from the resources available to serve the citizens directly. As we note, public transport buses are often random to the citizen (the customer), which is not aware if the bus dedicated to a particular transport line is close to him and how long the bus needs to reach. Therefore, most of the citizens' problems will be solved, especially the problem of long waiting or delay in work on buses, not to mention the benefit that students will receive, such as leaving the house at a certain time. Within a certain transport line so that no time is wasted waiting if the bus misses.

We also notice that there are buses transporting citizens from the city to the countryside and vice versa. We know that the number of these buses is limited and at certain times, so if the citizen misses the date of this edge, he will pay a large amount to reach his destination.

This application will solve the problem of all rural residents by knowing the location of the bus they will take home or to work.

In addition to other services will be provided to the citizen, for example:

- Determine the location of the user's location directly.
- Find any place on the map.

Know the ways out of service for maintenance reason or so. Therefore, the citizen will not be forced to go from that road and lose his time.
